

Gauge Transformation and Perturbation of the Canonical General Relativity

Yi-Fan Wang (王一帆)

May 14, 2018

Gauge structure is one of the corner stones in modern theoretical physics. In particle physics, where fundamental interactions are modelled by Yang–Mills theories, gauge structure is an *input* of the theoretical description, and mathematical physicists use redundant variables in the configuration space such that the gauge invariance is manifest.

In gravitational physics, things are less clear compared to the former case. On the one hand, if one follows the way by which a Yang–Mills theory would be constructed, one derives Poincaré gauge theories, which is much more generic than the acknowledged General Relativity. On the other hand, even if one starts with General Relativity and call the reparametrisation invariance as a gauge invariance, one still faces another challenge, that in many applications, the theory is not written down with those variables where the gauge invariance is most manifest and the gauge transformation is simplest. The usage of the Arnowitt–Deser–Misner variables is such an example.

Let us be more specific. If one uses components of the metric $\{g_{\mu\nu}\}$ as the (superficial) degrees of freedom, the gauge transformation of which is related to the infinitesimal general coordinate transformation

$$x^\mu \mapsto x^\mu - \eta^\mu(x) + O(\eta^2) \quad (1)$$

by

$$\begin{aligned} \delta g_{\mu\nu} &= \mathbb{L}_\eta g_{\mu\nu} + O(\eta^2), \\ \mathbb{L}_\eta g_{\mu\nu} &= \eta_{\mu;\nu} + \eta_{\nu;\mu} = \eta^\lambda g_{\mu\nu,\lambda} + \eta^\lambda_{,\mu} g_{\lambda\nu} + \eta^\lambda_{,\nu} g_{\mu\lambda}. \end{aligned} \quad (2)$$

Here the generator of the general coordinate transformation $\eta^\mu(x)$ plays the role of the gauge generator.

In the canonical formalism, the common practice is to use the Arnowitt–Deser–Misner variables $\{N, N_i, h_{ij}\}$, instead of $\{g_{\mu\nu}\}$. The former ones are an alternative set of variables in the configuration space, and are related to the latter by

$$g_{\mu\nu} dx^\mu dx^\nu = ds^2 = -N^2 dt^2 + h_{ij}(N^i dt + dx^i)(N^j dt + dx^j), \quad (3)$$

where N^i is understood as $h^{ij}N_j$, and h^{ij} are implicit functions of h_{ij} . One expects that $\{N, N_i, h_{ij}\}$ and $\{g_{\mu\nu}\}$ share the same gauge structure; however, the gauge transformation of the two variables looks quite differently.

In this work, we are interested in the canonical formalism, and the gauge structure will be described by gauge transformation in *phase space*. It is less well-known that one can also derive a Hamiltonian action consistently by using $\{g_{\mu\nu}\}$ and their conjugate momenta $\{\rho^{\mu\nu}\}$, as Dirac has done in [2]. The Dirac and the Arnowitt–Deser–Misner approaches have been compared in [5], where some subtle differences have been shown; in particular, the gauge transformation (in the phase space) in the former case (eq. (2)) is different than the latter one (eqs. (28) to (33)). This difference can be quantified, in the sense that the relation between $\{\eta_\mu\}$ and $\{\xi_\perp, \xi_i\}$, which are the gauge generator of the Dirac and Arnowitt–Deser–Misner approaches respectively, can be derived explicitly.

Here we go with outlooks. We would like to see if this difference has any consequence on the cosmological perturbation theory; in particular, we would like to see if the gauge-invariant variables could be changed from this perspective. In order to do this, we start from the Hamiltonian formalism in the Arnowitt–Deser–Misner variables and derive the gauge transformations of all the canonical variables; we then perturb the Hamiltonian action up to the second order on an arbitrary background with those variables directly; and finally we fix a Robertson–Walker background metric and discuss the gauge transformation of the perturbative coordinates and momenta.

1 Canonical transformation between the Dirac and ADM variables

In this section we will see that the Dirac and the Arnowitt–Deser–Misner canonical variables, $\{g_{\mu\nu}; \rho^{\mu\nu}\}$ and $\{N, N_i, h_{ij}; \mathfrak{P}, \mathfrak{P}^i, \mathfrak{p}^{ij}\}$, are related by a canonical transformation, where in the momentum sector, coordinates and momenta *mix up*. This could be surprising, since one might expect that those canonical variables are related by a *point transformation*.

From eq. (3), one can read off the relations between $\{g_{\mu\nu}\}$ and $\{N, N_i, h_{ij}\}$, motivating one to use the generating functional of the third type $F_3 = F_3[\rho^{\mu\nu}; N, N_i, h_{ij}]$. Then the relations can be written as

$$g_{00} = -N^2 + h^{ij}N_iN_j = -\frac{\delta F_3}{\delta \rho^{00}}, \quad (4)$$

$$g_{i0} = N_i = -\frac{\delta F_3}{\delta \rho^{i0}}, \quad g_{0i} = -\frac{\delta F_3}{\delta \rho^{0i}}, \quad (5)$$

$$g_{ji} = h_{ji} = -\frac{\delta F_3}{\delta \rho^{ji}}, \quad g_{ij} = -\frac{\delta F_3}{\delta \rho^{ij}}; \quad (6)$$

the inverse of eqs. (4) to (6) reads¹

$$N = \frac{1}{(-g^{00})^{1/2}}, \quad N_i = \frac{g_{i0} + g_{0i}}{2}, \quad h_{ij} = g_{ij}. \quad (7)$$

It is also useful to note that the transformation of the inverse metric is

$$g^{00} = -\frac{1}{N^2}, \quad g^{0i} = g^{i0} = \frac{N^i}{N^2}, \quad g^{ij} = h^{ij} - \frac{N^i N^j}{N^2}, \quad (8)$$

and the variation of N with respect to $\{g_{\mu\nu}\}$ reads

$$\delta N = \frac{1}{2} \left(-\sqrt{-g^{00}} \delta g_{00} + \frac{g^{0i} \delta g_{0i} + g^{i0} \delta g_{i0}}{(-g^{00})^{1/2}} - \frac{g^{0i} g^{0j}}{(-g^{00})^{3/2}} \delta g_{ij} \right). \quad (9)$$

Equations (4) to (6) can be formally integrated to get

$$F_3 = - \int \mathfrak{d}^3 x \{ \boldsymbol{\rho}^{00} (-N^2 + h^{ij} N_i N_j) + (\boldsymbol{\rho}^{0i} + \boldsymbol{\rho}^{i0}) N_i + \boldsymbol{\rho}^{ij} h_{ij} \}. \quad (10)$$

Calculation shows that the momenta transform as

$$\mathfrak{P} = -\frac{\delta F_3}{\delta N} = -2N \boldsymbol{\rho}^{00} = -\frac{2}{(-g^{00})^{1/2}} \boldsymbol{\rho}^{00}, \quad (11)$$

$$\mathfrak{P}^i = -\frac{\delta F_3}{\delta N_i} = +2N^i \boldsymbol{\rho}^{00} + \boldsymbol{\rho}^{0i} + \boldsymbol{\rho}^{i0} = -\frac{g^{0i} + g^{i0}}{g^{00}} \boldsymbol{\rho}^{00} + \boldsymbol{\rho}^{0i} + \boldsymbol{\rho}^{i0}, \quad (12)$$

$$\mathfrak{p}^{ij} = -\frac{\delta F_3}{\delta h_{ij}} = -N^i N^j \boldsymbol{\rho}^{00} + \boldsymbol{\rho}^{ij} = -\frac{g^{0i} g^{0j}}{(g^{00})^2} \boldsymbol{\rho}^{00} + \boldsymbol{\rho}^{ij}. \quad (13)$$

The inverse transformations of eqs. (11) to (13) are

$$\boldsymbol{\rho}^{00} = -\frac{\mathfrak{P}}{2N}, \quad \boldsymbol{\rho}^{0i} = \boldsymbol{\rho}^{i0} = \frac{\mathfrak{P}^i}{2} + N^i \frac{\mathfrak{P}}{2N}, \quad \boldsymbol{\rho}^{ij} = \mathfrak{p}^{ij} - N^i N^j \frac{\mathfrak{P}}{2N}. \quad (14)$$

One can verify that

$$\mathfrak{P} \delta N + \mathfrak{P}^i \delta N_i + \mathfrak{p}^{ij} \delta h_{ij} = \boldsymbol{\rho}^{\mu\nu} \delta g_{\mu\nu} \quad (15)$$

holds, which is a criterion for the canonicity of a time-independent transformation; one may further verify that the fundamental Poisson in the old brackets²

$$[g_{\mu\nu}(x_1), \boldsymbol{\rho}^{\rho\sigma}(x_2)]_{\text{P}} = \frac{1}{2} (\delta^\rho_\mu \delta^\sigma_\nu + \delta^\sigma_\mu \delta^\rho_\nu) \boldsymbol{\delta}^{(3)}(x_1, x_2); \quad (16)$$

¹We take $N > 0$.

²Note that $[h_{12}, \mathfrak{p}^{12}] \propto 1/2$, not 1 !

and new variables

$$\begin{aligned}
[N(x_1), \mathfrak{P}(x_2)]_{\text{P}} &= \delta^{(3)}(x_1, x_2), \\
[N_i(x_1), \mathfrak{P}^j(x_2)]_{\text{P}} &= \delta^j_i \delta^{(3)}(x_1, x_2), \\
[h_{ij}(x_1), \mathfrak{p}^{kl}(x_2)]_{\text{P}} &= \frac{1}{2}(\delta^k_i \delta^l_j + \delta^l_i \delta^k_j) \delta^{(3)}(x_1, x_2); \\
[N(x_1), \mathfrak{P}^i(x_2)] &= [N(x_1), \mathfrak{p}^{ij}(x_2)] = [N^i(x_1), \mathfrak{p}^{jk}(x_2)] = 0
\end{aligned} \tag{17}$$

are invariant.

2 Canonical actions and their first variations

The canonical action for General Relativity in terms of the Arnowitt–Deser–Misner canonical variables is [4, ch. 4.2.2]

$$\begin{aligned}
S = \int dt dx^3 \Big\{ & \mathfrak{p}^{ij} \dot{h}_{ij} + \mathfrak{P} \dot{N} + \mathfrak{P}^i \dot{N}_i - N \mathfrak{H}^\perp - N_i \mathfrak{H}^i \\
& - \mathfrak{P} V - \mathfrak{P}^i V_i \Big\} + \text{boundary terms},
\end{aligned} \tag{18}$$

where \mathfrak{P} and \mathfrak{P}^i are the primary constraints,

$$\mathfrak{H}^\perp = 2\mathfrak{H} \mathfrak{G}_{ijkl} \mathfrak{p}^{ij} \mathfrak{p}^{kl} - \frac{\sqrt{\mathfrak{h}}}{2\mathfrak{H}} R[h] \equiv 2\mathfrak{H} \mathfrak{F}^{ijkl} h_{ij} h_{kl} - \frac{\sqrt{\mathfrak{h}}}{2\mathfrak{H}} R[h], \tag{19}$$

$$\mathfrak{H}^i = -2\mathfrak{p}^{ij}{}_{|j} \tag{20}$$

are the secondary constraints,

$$\mathfrak{G}_{ijkl} := \frac{1}{2\mathfrak{h}^{1/2}} (h_{ik} h_{lj} + h_{il} h_{kj} - h_{ij} h_{kl}) \equiv -\frac{\delta(\mathfrak{h}^{-1/2} h_{ij})}{\delta h^{kl}}, \tag{21}$$

$$\mathfrak{F}^{ijkl} := \frac{\mathfrak{h}^{1/2}}{2} (h^{ik} h^{lj} + h^{il} h^{kj} - 2h^{ij} h^{kl}) \equiv -\mathfrak{h}^{-1/2} \frac{\delta(\mathfrak{h} h^{ij})}{\delta h_{kl}} \tag{22}$$

are the DeWitt metric and its inverse, and

$$\mathfrak{F}^{ijkl} := \frac{1}{2\mathfrak{h}^{1/2}} (\mathfrak{p}^{ik} \mathfrak{p}^{jl} + \mathfrak{p}^{il} \mathfrak{p}^{kj} - \mathfrak{p}^{ij} \mathfrak{p}^{kl}) \tag{23}$$

is a convenient notation. In eq. (18), V and V_i are velocities of N and N_i and play the role of Lagrange multipliers. Details about the action with velocities can be found in [3]; those about the boundary terms can be found in [6, ch. 4.2] and the references therein.

Using the results in appendix A.1, the first variation of eq. (18) can be derived to be

$$\begin{aligned}
\delta S = \int dt d^3x \Big\{ & -(\mathfrak{p}^{ij} - \mathcal{P}^{ij}(N, N_i)) \delta h_{ij} + (\dot{h}_{ij} - \mathcal{H}_{ij}(N, N_i)) \delta \mathfrak{p}^{ij} \\
& - (\dot{\mathfrak{P}} + \mathfrak{H}^\perp) \delta N - (\dot{\mathfrak{P}}^i + \mathfrak{H}^i) \delta N_i + (\dot{N} - V) \delta \mathcal{P} + (\dot{N}_i - V_i) \delta \mathcal{P}^i \\
& - \mathfrak{P} \delta V - \mathfrak{P}^i \delta V_i \Big\},
\end{aligned} \tag{24}$$

where

$$\mathcal{H}_{ij}(N, N_i) := 2 \left(2\kappa N \mathfrak{G}_{ijkl} \mathfrak{p}^{kl} + N_{(i|j)} \right), \quad (25)$$

$$\begin{aligned} \mathcal{P}^{ij}(N, N_i) := & 2\kappa N \left(\frac{1}{2} h^{ij} \mathfrak{F}^{klmn} h_{mn} - 2\mathfrak{F}^{ijkl} \right) h_{kl} \\ & + \frac{1}{2\kappa} \left(-N \sqrt{\mathfrak{h}} G^{ij}[h] + \mathfrak{G}^{ijkl} N_{[k|l]} \right) \\ & - \left\{ (h^{ki} \mathfrak{p}^{jl} + h^{kj} \mathfrak{p}^{il} - h^{kl} \mathfrak{p}^{ij}) N_k \right\}_{|l}. \end{aligned} \quad (26)$$

Also notes that in eq. (24) no further boundary term is present; those in eq. (18) have all been used to eliminate the boundary integral with first derivatives.

3 Infinitesimal canonical gauge transformation

In this section the infinitesimal gauge transformation in General Relativity will be constructed in the canonical formalism, namely in phase space. The results with the Arnowitt–Deser–Misner variables and the Dirac variables will be worked out separately. In the former case, one sees that the lapse and shift functions as well as their conjugate momenta are also involved in the gauge transformation, and the action has to contain them in order to be invariant under the transformation.

3.1 The Arnowitt–Deser–Misner canonical variables

Gauge transformations in the Arnowitt–Deser–Misner canonical variables are generated by [1]

$$\begin{aligned} G = & - \int \mathfrak{d}^3x \left\{ \left[\xi_{\perp} \left(\mathfrak{H}^{\perp} + N_{|i} \mathfrak{P}^i + (N \mathfrak{P}^i)_{|i} + (N_i \mathfrak{P})^{|i} \right) + \dot{\xi}_{\perp} \mathfrak{P} \right] \right. \\ & \left. + \left[\xi_i \left(\mathfrak{H}^i + N_j^{|i} \mathfrak{P}^j + (N_j \mathfrak{P}^i)^{|j} + N^{|i} \mathfrak{P} \right) + \dot{\xi}_i \mathfrak{P}^i \right] \right\} \\ & + \text{boundary terms}, \end{aligned} \quad (27)$$

where the boundary terms have probably not been discussed so far, but are surely needed for non-compact spatial topologies in order to cancel the second spatial derivatives in the potential term in \mathfrak{H}^{\perp} . The infinitesimal gauge transformations of $\{N, N_i; \mathfrak{P}, \mathfrak{P}^i\}$ are [5]

$$\delta N = [N, G]_{\text{P}} = \xi_{\perp}^{|i} N_i - \dot{\xi}_{\perp} - \xi_i N^{|i}, \quad (28)$$

$$\delta N_i = -\xi_{\perp} N_{|i} + \xi_{\perp |i} N - \xi_j N_i^{|j} + \xi_i^{|j} N_j - \dot{\xi}_i; \quad (29)$$

$$\delta \mathfrak{P} = -(\xi_{\perp} \mathfrak{P}^i)_{|i} - \xi_{\perp |i} \mathfrak{P}^i - (\xi_i \mathfrak{P})^{|i}, \quad (30)$$

$$\delta \mathfrak{P}^i = -\xi_{\perp}^{|i} \mathfrak{P} - (\xi_j \mathfrak{P}^i)^{|j} - \xi_j^{|i} \mathfrak{P}^j, \quad (31)$$

where only the primary constraints are involved; transformations of $\{g_{ij}; \mathfrak{p}^{ij}\}$ are

$$\delta h_{ij} = -\frac{\partial}{\partial \mathfrak{p}^{ij}}(\xi_{\perp} \mathfrak{H}^{\perp} + \xi_i \mathfrak{H}^i) = -\mathcal{H}_{ij}(\xi_{\perp}, \xi_i), \quad (32)$$

$$\delta \mathfrak{p}^{ij} = \frac{\partial}{\partial h_{ij}}(\xi_{\perp} \mathfrak{H}^{\perp} + \xi_i \mathfrak{H}^i) = -\mathcal{P}^{ij}(\xi_{\perp}, \xi_i), \quad (33)$$

where only the secondary constraints are involved.

3.2 The Dirac canonical variables

4 Perturbative expansion of the canonical action

A Some useful results

A.1 First variations

The first variation of the inverse metric h^{ij} reads

$$\delta h^{ij} = -h^{ik} h^{jl} \delta h_{kl} = -h^{i(k} h^{l)j} \delta h_{kl}. \quad (34)$$

The first variation of $\mathfrak{h} = \det h_{ij}$ reads

$$\delta \mathfrak{h} = \mathfrak{h} h^{ij} \delta h_{ij}. \quad (35)$$

The first variation of Γ^i_{jk} can be obtained in normal coordinates, which reads

$$\delta \Gamma^i_{jk} = \frac{1}{2} h^{il} \left\{ -(\delta h_{jk})_{|l} + (\delta h_{kl})_{|j} + (\delta h_{lj})_{|k} \right\} \quad (36)$$

$$= \frac{1}{2} \left\{ -h^{il} \delta^m_j \delta^n_k + h^{in} \delta^l_j \delta^m_k + h^{im} \delta^n_j \delta^l_k \right\} (\delta h_{mn})_{|l}. \quad (37)$$

The first variation of $R_{ij}[h]$ and $R^{ij}[h]$

$$\delta R_{ij}[h] = (\delta \Gamma^k_{ji})_{|k} - (\delta \Gamma^k_{ki})_{|j}, \quad (38)$$

$$\delta R^{ij}[h] = -2R^{k(i} h^{j)l} \delta h_{kl} + h^{k(i} \bar{\delta} u^{j)l}{}_{k|l}, \quad (39)$$

where

$$\bar{\delta} u^{ij}{}_k := h^{il} \delta \Gamma^j_{lk} - h^{ij} \delta \Gamma^l_{lk} \quad (40)$$

is related to the boundary terms. Equation (38) can be obtained in normal coordinates.

For the first variation of the constraints, one also needs

$$\bar{\delta} u^{ji}{}_j = (\delta h_{kl})_{|j} (h^{i(k} h^{l)j} - h^{ij} h^{kl}) = \mathfrak{h}^{-1/2} \mathfrak{G}^{ijkl} (\delta h_{kl})_{|j}; \quad (41)$$

therefore,

$$\sqrt{\mathfrak{h}} N \bar{\delta} u^{ij}_{j|i} = \delta h_{ij} \mathfrak{G}^{ijkl} N_{|k|l} + \left\{ \mathfrak{G}^{ijkl} \left(N (\delta h_{kl})_{|j} - N_{|j} \delta h_{kl} \right) \right\}_{|i}. \quad (42)$$

In the Hamiltonian constraint, the first variation of the ‘kinetic term’ $\mathfrak{G}_{ijkl} \mathfrak{p}^{ij} \mathfrak{p}^{kl} \equiv \mathfrak{F}^{ijkl} h_{ij} h_{kl}$ reads

$$\begin{aligned} \delta(\mathfrak{G}_{ijkl} \mathfrak{p}^{ij} \mathfrak{p}^{kl}) &\equiv \delta(\mathfrak{F}^{ijkl} h_{ij} h_{kl}) \\ &= \delta h_{ij} \left(-\frac{1}{2} h^{ij} \mathfrak{F}^{klmn} h_{mn} + 2 \mathfrak{F}^{ijkl} \right) h_{kl} + \delta \mathfrak{p}^{ij} 2 \mathfrak{G}_{ijkl} \mathfrak{p}^{kl}. \end{aligned} \quad (43)$$

Equipped with eqs. (39) and (41), the first variation of the ‘potential’ $\sqrt{\mathfrak{h}} R[h]$ reads

$$\begin{aligned} \delta(\sqrt{\mathfrak{h}} R[h]) &= \sqrt{\mathfrak{h}} \left\{ -G^{ij}[h] \delta h_{ij} + \bar{\delta} u^{ij}_{j|i} \right\} \\ &= -\sqrt{\mathfrak{h}} G^{ij}[h] \delta h_{ij} + \mathfrak{G}^{ijkl} (\delta h_{kl})_{|j|i}. \end{aligned} \quad (44)$$

One can now write down the first variation of $N \mathfrak{H}^\perp$ with respect to $\{h_{ij}, \mathfrak{p}^{ij}\}$,

$$\begin{aligned} N \delta \mathfrak{H}^\perp &= \delta h_{ij} \left\{ 2 \mathcal{N} N \left(-\frac{1}{2} h^{ij} \mathfrak{F}^{klmn} h_{mn} + 2 \mathfrak{F}^{ijkl} \right) h_{kl} \right. \\ &\quad \left. + \frac{1}{2 \mathcal{N}} \left(\sqrt{\mathfrak{h}} N G^{ij}[h] - \mathfrak{G}^{ijkl} N_{|k|l} \right) \right\} \\ &\quad + \delta \mathfrak{p}^{ij} 4 \mathcal{N} N \mathfrak{G}_{ijkl} \mathfrak{p}^{kl} \\ &\quad - \frac{1}{2 \mathcal{N}} \left\{ \mathfrak{G}^{ijkl} \left(N (\delta h_{kl})_{|j} - N_{|j} \delta h_{kl} \right) \right\}_{|i}, \end{aligned} \quad (45)$$

where the terms in the last line will be pushed to the spatial boundary $\partial \Sigma$; the second term vanishes by $\delta h_{ij}|_{\partial \Sigma} = 0$, whereas the first one is cancelled by the boundary term.

Finally, the first variation of $N_i \mathfrak{H}^i$ with respect to $\{h_{ij}, \mathfrak{p}^{ij}\}$ is easier,

$$\begin{aligned} N_i \delta \mathfrak{H}^i &= \delta h_{ij} \{ (h^{ki} \mathfrak{p}^{jl} + h^{kj} \mathfrak{p}^{il} - h^{kl} \mathfrak{p}^{ij}) N_k \}_{|l} + \delta \mathfrak{p}^{ij} 2 N_{(i|j} \\ &\quad - (-h^{il} \delta^m_j \delta^n_k + h^{in} \delta^l_j \delta^m_k + h^{im} \delta^n_j \delta^l_k) (N_i \mathfrak{p}^{jk} \delta h_{mn})_{|l} \\ &\quad - 2 (\delta \mathfrak{p}^{ij} N_j)_{|i}, \end{aligned} \quad (46)$$

where the last two lines will be pushed to the spatial boundary and vanish by $\delta h_{ij}|_{\partial \Sigma} = 0 = \delta \mathfrak{p}^{ij}|_{\partial \Sigma}$. The results can be checked with [6, ch. 4.2.7].

Second variations

First variation of $\mathfrak{F}^{ijkl}h_{kl}$

$$\begin{aligned}\delta(\mathfrak{F}^{ijkl}h_{kl}) &= \delta h_{kl} \left(-\frac{1}{2} \mathfrak{F}^{ijmn} h^{kl} h_{mn} + \mathfrak{F}^{ijkl} \right) \\ &\quad + \delta p^{kl} (\delta^i_k \mathfrak{G}^j_{lmn} + \delta^i_m \mathfrak{G}^j_{nkl}) p^{mn}.\end{aligned}\quad (47)$$

First variation of $\mathfrak{G}_{ijkl}p^{kl}$

$$\begin{aligned}\delta(\mathfrak{G}_{ijkl}p^{kl}) &= \delta h_{kl} \left(-\frac{1}{2} \mathfrak{G}_{ijmn} h^{kl} + \delta^k_i \mathfrak{G}^l_{jmn} + \delta^k_m \mathfrak{G}^l_{nij} \right) p^{mn} \\ &\quad + \delta p^{kl} \mathfrak{G}_{ijkl}.\end{aligned}\quad (48)$$

First variation of $\sqrt{\mathfrak{h}} G^{ij}[h]$

$$\begin{aligned}\delta(\sqrt{\mathfrak{h}} G^{ij}[h]) &= \sqrt{\mathfrak{h}} \left\{ \delta h_{kl} \right. \\ &\quad \left(-\frac{1}{2} \right) (R^{ik} h^{lj} + R^{il} h^{kj} - R^{ij} h^{kl} + h^{ik} G^{lj} + h^{il} G^{kj} - h^{ij} G^{kl}) \\ &\quad \left. + \left(h^{il} \bar{\delta} u^{jk}{}_l - \frac{1}{2} h^{ij} \bar{\delta} u^{lk}{}_l \right) \right\}_{|k}.\end{aligned}\quad (49)$$

For the following calculation, one also needs

$$h^{k(i} \bar{\delta} u^{j)l}{}_{k|l} = \quad (50)$$

About $\bar{\delta} u^{ij}{}_k$, the identity

$$\sqrt{\mathfrak{h}} N h^{k(i} \bar{\delta} u^{j)l}{}_{k|l} = \quad (51)$$

is also useful.

Second variation of $N\mathfrak{H}^\perp$

$$\begin{aligned}&\delta^2(N\mathfrak{H}^\perp) \\ &= \delta h_{ij} \delta h_{kl} \left\{ 2\mathfrak{H} \left[\frac{1}{4} (h^{ik} h^{lj} + h^{il} h^{kj} + h^{ij} h^{kl}) \mathfrak{F}^{mnrs} h_{mn} h_{rs} \right. \right. \\ &\quad \left. \left. - (h^{ij} \mathfrak{F}^{klmn} + \mathfrak{F}^{ijmn} h^{kl}) h_{mn} + \mathfrak{F}^{ijkl} \right] \right. \\ &\quad \left. - \frac{\sqrt{\mathfrak{h}}}{4\mathfrak{H}} (R^{ik} h^{lj} + R^{il} h^{kj} - R^{ij} h^{kl} + h^{ik} G^{lj} + h^{il} G^{kj} - h^{ij} G^{kl}) \right\} \\ &\quad + \delta h_{ij} \frac{\sqrt{\mathfrak{h}}}{2\mathfrak{H}} \left(h^{il} \bar{\delta} u^{jk}{}_l - \frac{1}{2} h^{ij} \bar{\delta} u^{lk}{}_l \right)_{|k} \\ &\quad + \delta h_{ij} \delta p^{kl} 4\mathfrak{H} \{ -h^{ij} \mathfrak{G}_{klmn} + 2(\delta^i_k \mathfrak{G}^j_{lmn} + \delta^i_m \mathfrak{G}^j_{nkl}) \} p^{mn} \\ &\quad + \delta p^{ij} \delta p^{kl} 4\mathfrak{H} \mathfrak{G}_{ijkl} \\ &\quad - \delta h_{ij} \delta \left(\frac{\sqrt{\mathfrak{h}}}{2\mathfrak{H}} \bar{\delta} u^{lk}{}_l \right)_{|k}.\end{aligned}\quad (52)$$

Second variation of Γ^i_{jk}

$$\delta^2 \Gamma^i_{jk} = -h^{im} \delta \Gamma^l_{jk} \delta h_{lm}. \quad (53)$$

Second variation of \mathfrak{H}^i

$$\delta^2(\mathfrak{H}^i) = -h^{im} p^{jk} \delta \Gamma^l_{jk} \delta h_{lm} + 2 \delta \Gamma^i_{jk} \delta p^{jk}. \quad (54)$$

Other second variations

Second variation of h^{ij}

$$\delta^2 h^{ij} = (h^{im} h^{jl} h^{kn} + h^{ik} h^{jm} h^{ln}) \delta h_{kl} \delta h_{mn} \quad (55)$$

Second variation of $\mathfrak{h} = \det h_{ij}$

$$\delta^2 \mathfrak{h} = -\frac{1}{4} \mathfrak{h} (h^{ik} h^{jl} + h^{il} h^{kj} - h^{ij} h^{kl}) \delta h_{ij} \delta h_{kl}. \quad (56)$$

First variation of $(\delta h_{ij})|_k$

$$\delta \left\{ (\delta h_{ij})|_k \right\} = -2 \delta \Gamma^l_{k(i} \delta h_{j)l}. \quad (57)$$

In a general background, the second variations of the quantities are much more tedious.

In Robertson–Walker background,
